

Spiders

Fascinating Facts

Spiders belong to a group called "arachnids". They all have eight legs and two main body parts. Most spiders build webs to catch their prey. The webs are made from silk that they spin. The silk is very strong and on a weight by weight basis stronger than steel!

All spiders have fangs and most of them have venom in them. The majority of the spiders we meet don't have big enough fangs to penetrate human skin and their venom is quite weak.
