

Oceans and Ocean Zones

Sunlight Zone – 0 to 200 metres

The warmest layer of the ocean, warmed by the sun. Most of the ocean plants and animals live in this layer.

Twilight Zone – 200 to 1000 metres

This layer is a lot colder than the sunlight layer and the light is very faint.

Dark Zone – 1000 to 4000 metres

The only visible light in this zone is that produced by the creatures themselves. The creatures that live here find prey using senses other than sight.

Abyss – 4000 to 6000 metres

The water temperature here is near freezing with very few creatures living here due to the immense pressure and temperature.

Trenches – 6000 metres to bottom

This zone is very cold with massive amount of pressure. Few creatures live here although some can still be found such as starfish and tube worms.
